

Is Pinegrow the right choice for you?

If you don't know what HTML elements and CSS rules are, and you're just looking for a simple drag and drop editor to quickly build a website without knowing what happens in the background, then Pinegrow is maybe not the right tool for you.

On the other hand, Pinegrow is a good choice for you if:

- You're proficient with HTML and CSS and **want a powerful editor** that combines visual tools with code editing and integrates well into your existing workflow.
- You aren't familiar with HTML and CSS yet, but **need a playground** where you can learn them well.
- You're **working with Bootstrap or Foundation** and don't want to remember hundreds of framework classes and are tired of copy-pasting the code of various components.
- You prefer to work with HTML and CSS directly and have **complete control over your code** or need flexibility that code generators can't provide.
- You wish to **automate your development workflow** by using reusable component libraries, master pages and editable areas.
- You are looking for a **simple CMS for static HTML websites**, either for yourself or for your clients.
- You need an easy way to **convert HTML websites into WordPress themes**.

- You're looking for an efficient alternative to a cloud-based or subscription-based web editing software.

Still undecided?

How about trying Pinegrow for free for 7 days? We have a FREE trial available for you!
